SENSATIONAL S2 HAS HEATING UNDER CONTROL

Comap Westco has introduced two stunning new thermostatic radiator valves to its extensive range of heating products: the S2 and the Westherm 5.

Precision engineered, the S2 liquid sensor TRV features a high design finish. Its sleek, stylish chrome on white temperature control head adds the finishing touch to any radiator or towel warmer. The ultimate in luxury, its neat, compact head is designed for ease of use, with clearly visible settings, control graduations and an ergonomic shape.

The Westherm 5 TRV also combines looks and functionality, benefiting from all the precision of the traditional Westherm valves, combined with fresh visual appeal. The simple look blends perfectly into any room.

Fast and easy to assemble, the Westherm 5 is available in a full range of time saving, hassle-free options. The Westherm 5 radiator pack includes a 10mm Sudofit pushfit bend. This is ideal where pipework is installed in the dry lining and pipes come through the wall to meet the radiator: the Sudofit bend makes it unnecessary to use additional fittings to complete the connection. Further, the Sudofit bend makes the installation fully demountable and all parts can be re-used – perfect for decorating.

Manufactured in one of Comap's state-of-the-art European factories, both valves meet the highest technical specifications: guaranteed for five years, they feature minimum settings and frost protection, as well as the ability to lock and limit the temperature range for excellent energy efficiency. Fully reversible, the TRVs are available in angled and straight, and the Westherm 5 is also available with a lockshield valve.
