

NEW SOLAR INDICATORS FOR COMAP'S VISU CONTROL SYSTEM

Comap, the leading manufacturer and distributor of heating and plumbing products and the pioneer of crimping solutions in the UK, has introduced a new range of solar fittings to its Visu Control collection.

Comap's unique Visu Control technology offers installers quick, easy and unfailing proof that a secure crimp joint has been completed. If a fitting has been overlooked and left uncrimped, this patented system allows installers to rectify the situation at the time of installation, rather than later when the system is being filled or pressure tested.

The Visu Control system consists of a coloured ring at either end of the copper crimp fitting, which becomes distorted once crimped, altering the shape of the plastic ring and allowing it to be removed by hand. A fitting with no plastic ring is proof of a secure connection.

Already available on a large range Comap's Sudopress copper crimp fittings, Visu Control is colour coded for ease of reference. Currently, a green ring denotes WRAS approved water fittings whilst a yellow ring is used for Gastec certified gas fittings. Comap's latest addition to the collection is a red indicator ring, used for solar fittings, managing both temperatures and pressures.

Ged Grimes, Sales Director at Comap, commented: "This latest addition to the Visu Control range was a natural progression, as Comap is dedicated to continually improving the functionality and performance of all products and solar fittings have become increasingly popular. The Visu Control range is a big favourite with our customers, and we expect the solar fitting indicator to be equally successful."

Manufactured in Comap's state-of-the-art European factories, all Visu Control fittings feature Sudopress' trademark double crimp, ensuring industry-leading security and reliability. Available in a range of sizes and diameters the fittings are compatible with all profile V tools.
